MEET VIYAM

Know your money. Make your next move.

A considered Android budgeting experience for everyday spending, multiple accounts and the money you move toward your future.

Viyam

Your alerts. Your categories. Your control.

01

Catch the activity

Save every alert from the senders you approve.

02

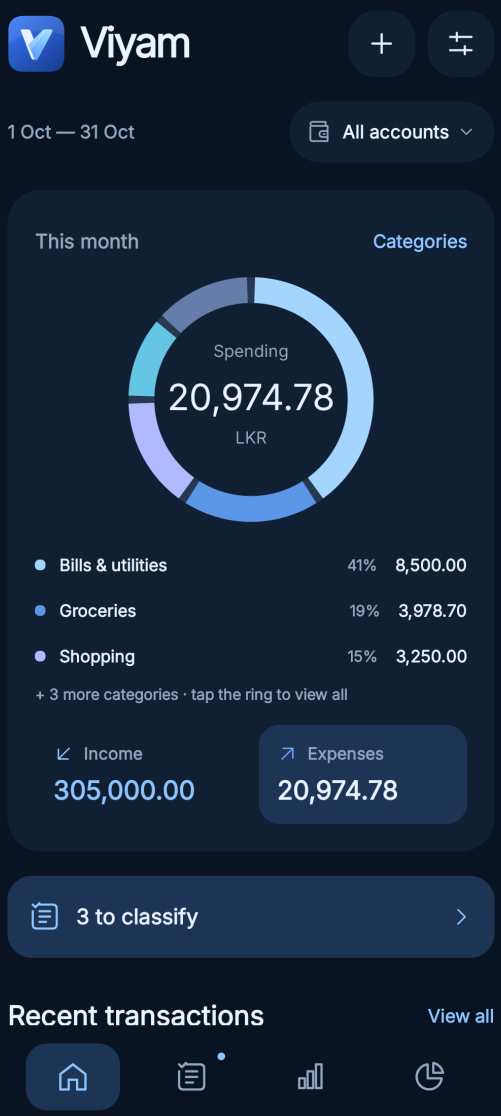

Give it meaning

Classify income and spending with the source message close by.

03

See the pattern

Understand categories, trends and investment movements.

VERSION 1.0.0 / YOUR MONEY, WITH MORE CONTROL

BEFORE YOU BEGIN / INSTALLATION

Get Viyam onto your Android phone.

These steps are for a privately shared development APK. Only install a file obtained directly from the creator or another source you have verified.

1

Open the APK

Download the Viyam APK and open it from your browser, Downloads or file manager. If Android asks, open Settings to allow installation from that source.

2

Allow this installation source

On Android 8 or later: Settings > Apps > Special app access > Install unknown apps. Select the app opening the APK, such as Chrome or My Files, then enable Allow from this source. Return to the APK and tap Install. Menu names vary by phone.

3

If you choose to pause Play Protect

Try installing with protection enabled first; accept a scan if offered. To temporarily turn scanning off: Play Store > profile picture > Play Protect > Settings (gear) > turn off Scan apps with Play Protect, then confirm if prompted. Retry the APK installation.

4

Turn protection back on immediately

After the installation attempt, return to the same Play Protect setting and turn Scan apps with Play Protect on. Also turn off Allow from this source for the browser or file manager. Open Viyam to begin setup.

Pausing protection reduces device security

Google recommends keeping Play Protect enabled. Its switch is not a timed pause. Changing it does not certify an APK as safe or guarantee installation. SMS permissions may trigger blocks; if blocking continues, stop and contact the creator for a verified build.

Official guidance: Install apps from other sources / Play Protect settings / Sensitive-permission blocks

01 / THE EXPERIENCE

A clear place for every money decision.

Viyam brings recorded income, spending, account movements and budgets into one focused app, with a midnight-blue interface and simple icon navigation.

01

Home

A cleaner category donut, ranked amounts and percentages, income and expense totals, plus the review queue.

02

Activity

Review your transaction history. Filter income, expenses or pending records and open an individual record.

03

Budget

Set an overall monthly limit and optional category limits. Track recorded spending against your plan.

04

Reports

Explore weekly or monthly trends, category breakdowns, top merchants and investment movements.

One account or the whole picture

Account filters let you focus on a single account or view the combined recorded activity. Settings stays one tap away through its icon.

Inside this guide

Install 02 / Setup 04 / Senders & accounts 05 / Home 06
Custom categories 07 / Classification 08 / Faster review 09
Budgets 10 / Transfers 11 / Reversals 12 / Review & ignore 13
Investments 14 / Reports 15 / Privacy & practical limits 16

02 / FIRST-RUN SETUP

Start where you are.

Pick an exact tracking date, make your budget cycle personal and connect bank senders to the accounts that matter to you.

1

Pick an exact date - past or future

Use Choose exact date for a past date, today or a future day. The boundary is local midnight. Today and the 1, 3, 6 and 12 month shortcuts are still available.

2

Make the month fit your life

Choose a budget reset day from 1 to 31. If a month is shorter than your selected day, Viyam uses its last day. A reset day of 25 follows a 25th-to-24th cycle.

3

Choose whether to connect SMS

Read the disclosure and grant SMS access if you want bank-alert import and incoming tracking. You can also use manual expense and income entry without SMS access.

4

Connect sender and account together

Open a detected sender, create an account or select an existing one, add an optional purpose, then use Save & track. A future start schedules incoming tracking; earlier alerts are not saved.

A date you can change later

Settings > Import history opens the same date picker. Past dates import available SMS from that day. Future dates schedule tracking; existing saved records stay intact.

03 / SENDERS & ACCOUNTS

Choose a conversation. Give it a home.

Custom account names and optional purposes let every user organize their own salary, savings, business or other accounts. No preset role is forced on you.

A searchable sender picker

Tap Choose sender to open a searchable list of inbox senders. Suggested shows conversations with financial language; All senders lets you look beyond those suggestions.

See the latest alert

Open a sender preview and switch between Details and Latest message. Inspect the actual sender address, date and message before deciding to track it.

The actual sender stays visible

Viyam uses the SMS sender ID or phone number. It does not request Contacts permission or look up saved contact names. Previewing a conversation does not approve it or create ledger records.

Example	How it is handled
077 123 4567 / +94 77 123 4567	Grouped as the same Sri Lankan sender.
HNB / AD-HNB	Kept distinct; bank sender prefixes matter.
Several senders, one account	Supported. Each approved sender has one active account mapping.

Connect the sender and account together

Create an account or choose an existing one, enter an optional purpose, then Save & track. All approved-sender alerts are saved from your tracking date. Archiving an account preserves its history.

FEATURE SPOTLIGHT / THE NEW HOME VIEW

Your money mix. Clearer at a glance.

A refined donut pairs the overall picture with a compact ranked list, making the biggest categories easy to understand without filling the screen with tiny labels.

A cleaner ring

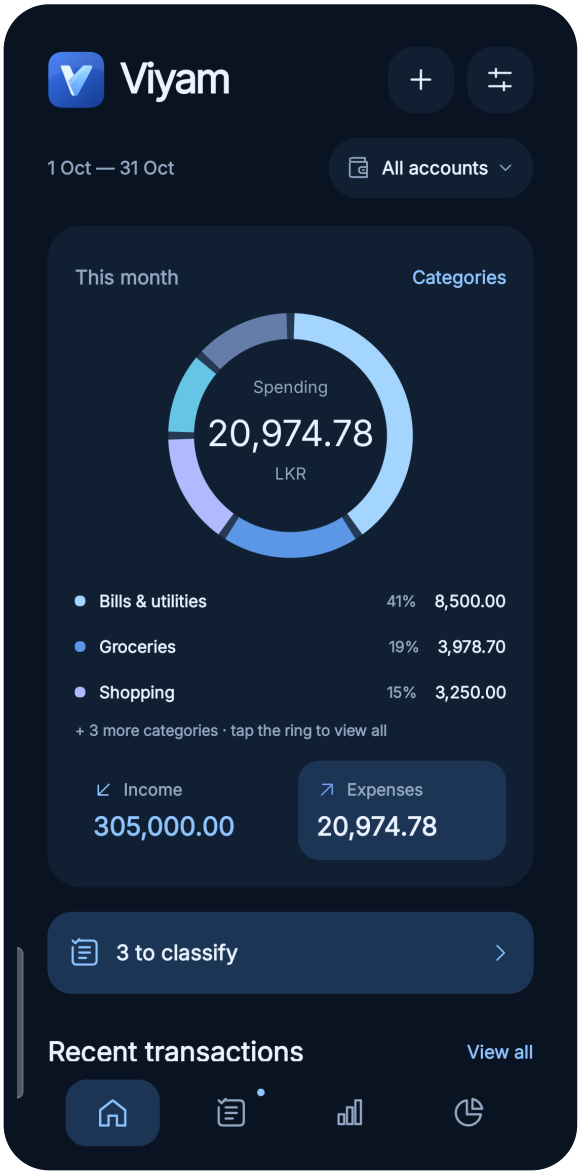

Separated segments and distinct blue shades make the mix easier to scan. The total scales to fit inside the ring, with Spending or Income clearly labelled.

Amounts beside the shares

The three largest categories appear beneath the donut, each with its recorded amount and percentage of the selected total. Matching colour dots connect the list to the ring.

Go from picture to records

Tap a listed category to open its transactions. Tap the ring or Categories to see the full breakdown. Switch between Income and Expenses using the total cards below.

A readable summary, with the details one tap away

When there are more than five categories, the ring combines the smaller ones into More categories. The full breakdown keeps every category visible. Empty cycles show a clear message.

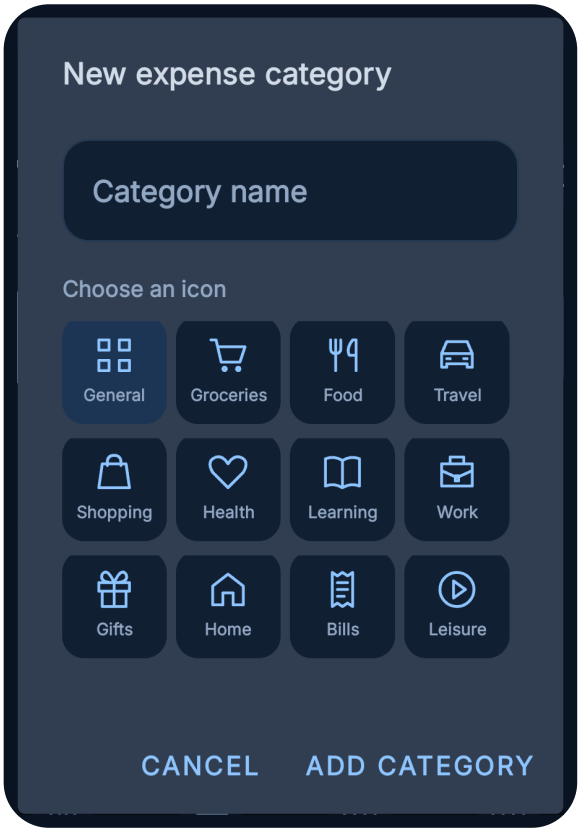

FEATURE SPOTLIGHT / CUSTOM CATEGORIES

Make room for your kind of spending.

Create your own expense and income categories, choose an icon and use them across Viyam. Your labels stay saved locally alongside the rest of your app data.

Name it. Give it an icon.

Create categories such as Pet care, Subscriptions or Freelancing. Choose from 12 icons covering everyday needs, home, work, learning and more.

Add it where you need it

Open Settings > Categories and choose Expenses or Income. You can also add a category while classifying a record or choosing a category budget.

Ready for the whole workflow

Saved custom categories appear in classification and reports. Expense categories can have budgets. Remembered merchant preferences, selectable pending matches and notification suggestions support them too.

Useful names, with the accounting rules protected

Names must be 1 to 30 characters. Viyam rejects blank names and duplicates, ignoring case and repeated spaces. Built-in names and special labels such as Investments remain reserved for their dedicated workflows.

04 / INCOME & EXPENSES

Every record gets context.

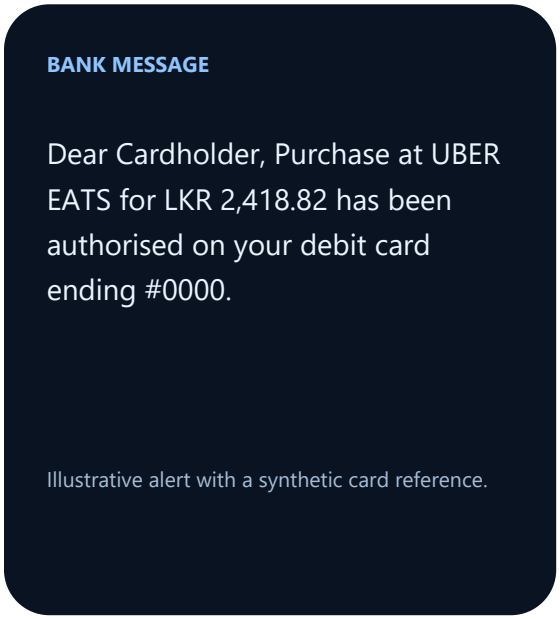

A useful budget starts with understanding what happened. Viyam keeps the transaction amount, account and original bank alert close to the classification decision.

Classify with clear icons

Choose a built-in or custom expense or income category from the icon grid. Suggestions help you decide; you confirm the choice.

Read the source

Use Bank message to view the stored original alert as selectable plain text. Approved source alerts stay with their records for later review.

Keep cash in the picture

Add expenses or income manually, including before a scheduled tracking start. Open existing records to adjust their category, account or remove a record.

Expense categories: Groceries, Food & drinks, Transport, Shopping, Bills & utilities, Health, Entertainment, Education, Bank fees, Transfers and Other.

Income has its own categories

Salary, Business income, Refund, Investment returns and Other income. A credit is not automatically salary, and a generic bank credit still needs your judgement.

05 / LESS REPEATED WORK

Classify once. Review the matches.

A remembered merchant preference can speed up onboarding and everyday review while leaving you in control of what gets changed.

1

Choose the category

Classify a record and tick Remember for this merchant when the record supports a merchant preference.

2

Review matching pending records

Viyam offers a selectable list with dates, amounts and bank-message access. Use Select all or tick only the records you want.

3

Apply to the selected records

Only eligible pending matches are updated. Records that were already classified or changed during review are protected.

4

Use the preference next time

Future transactions get a suggestion, including saved custom categories. You still confirm it, or explicitly classify through a notification action.

Matches use the same account, normalized exact merchant name and income/expense direction. Generic bank descriptions and unassigned bank records need individual review.

Quick actions, right in the notification

Standard income and expense alerts offer two category shortcuts plus Choose. Cancellations, unknown formats and missing-amount alerts offer Review. A shortcut applies only to that record and does not create a merchant rule.

06 / BUDGETING

A plan you can check at a glance.

Set a spending limit that works for your cycle, then use category limits and account filters to see where the pressure is building.

Overall monthly limit

Set or edit the total budget. Progress shows recorded spending and how much is left, or how far you are over.

Optional category limits

Add limits for built-in or custom expense categories. You can create a category from this picker. Category limits do not automatically add up to the overall budget.

Account-specific planning

An individual account can have its own overall budget and category limits. The All accounts budget is a separate setting.

Pending still counts

Known expense amounts count even before categorization. Own-account transfers and investment principal are excluded from expense budgets.

07 / MOVING MONEY

Move money.
Keep spending honest.

Money transferred between your own accounts should remain visible without inflating earned income or everyday spending.

Savings

LKR -40,000.00

>

Everyday account

LKR +40,000.00

ONE CONFIRMED OWN-ACCOUNT TRANSFER

Link both sides

Viyam can suggest opposite-direction, equal-amount bank records across accounts within three days. You confirm the match; both legs stay visible.

Handle a missing alert

If only one side has an SMS, you can explicitly record a manual opposite leg. A later real SMS can replace that leg after confirmation.

Keep fees separate

A transfer charge remains a spending item. In the supplied Amana example, the LKR 40,000 principal and LKR 25 fee are stored separately.

Undo when needed

Undo restores the original source transactions. Account filters still let you inspect the movement on each side.

An expense label is not a linked transfer

Choosing an ordinary Transfers expense category is different from confirming an own-account transfer. Use the transfer workflow to exclude the linked principal from spending.

08 / CANCELLATIONS & REVERSALS

When a payment comes back.

The original expense stays recorded. A reversal is a separate review item, whether or not its message includes an amount. Nothing is silently cancelled.

EXAMPLE CANCELLATION ALERT

YOUR TRANSACTION AT UBER ON YOUR CARD ENDING WITH 0000 HAS BEEN CANCELLED.

1

Inspect both messages

Read the reversal and original purchase alerts. Viyam supports the supplied Amana POS purchase format as well as its reversal notice.

2

Confirm the purchase and amount

Select the correct original purchase and confirm a positive amount. Partial reversals are supported; known-amount reversals also require confirmation.

3

Let the original record reflect it

Only a confirmed, linked reversal reduces the original transaction. It adjusts the original budget period rather than creating new earnings.

Bank sent the reversal by mistake? Ignore it.

An unlinked reversal changes no totals. Ignore a mistaken alert. Ignoring a confirmed reversal first undoes its adjustment, restoring the original amount. Restore brings the notice back for review.

09 / EVERY APPROVED ALERT

Nothing lost. Nothing guessed.

All messages from selected senders are retained locally from your start date. An unfamiliar message becomes a review item rather than disappearing from the ledger workflow.

NEEDS REVIEW

Unrecognized bank alert

Read the message. Choose what happens next.

Recognize the transaction

Read the saved Bank message, choose expense, income, transfer, investment or reversal, then enter a positive amount and confirm the account and description. Transfers and investments use their dedicated flows.

Or ignore the message

A service notice, OTP, promotion or erroneous alert can be ignored. Unknown alerts never affect totals until reviewed. Viyam does not expose the raw message in an unknown-alert notification.

Keep the decision reversible

Ignored messages stay available in Activity > Ignored and through Settings. Open the saved source and Restore when you want to reconsider. Reimport preserves existing ignore and classification decisions.

Protect linked records

Ordinary unlinked alerts can be ignored. Undo an existing transfer or investment link before ignoring its source. Confirmed reversals are safely undone as part of ignoring the notice.

Saving an alert is not the same as counting money

Unknown and ignored alerts stay outside financial totals. The original source is retained for review; ignoring is not deletion.

10 / INVESTING

Give future money its own place.

Investment contributions and withdrawals are separate movements, so investing does not distort your everyday expense budget.

Movement	How Viyam treats it
Contribution	Money added to an investment; excluded from income and spending.
Withdrawal	Money brought back from an investment; excluded from earned income and spending.
Return or profit	Use the Investment returns income category for an actual return you identify.
Associated fee	Remains an expense; it is not hidden inside the investment principal.

Count linked alerts once

You may confirm matching opposite-direction alerts from different accounts within three days. Linked investment alerts count once, including across cycle boundaries.

See the movement summary

Contributions, withdrawals and net contributed appear separately. Confirmed reversals reduce linked movements once and can be undone.

Movement is different from performance

Viyam does not track market prices, portfolio value or unrealized gains. An investment withdrawal is never automatically assumed to be profit.

11 / REPORTS

See the pattern. Choose your next move.

A dedicated Reports tab turns your recorded activity into a readable picture, using the same transfer-aware and reversal-aware rules as the ledger.

Pick a time horizon

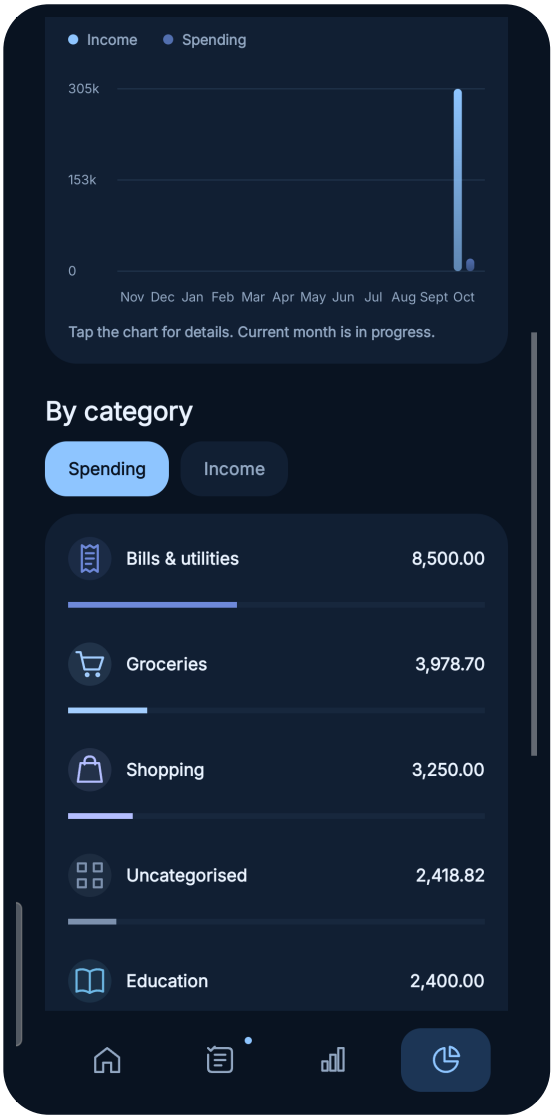

Choose 1, 3, 6 or 12 monthly budget cycles. Use the account filter for one account or the combined view.

Compare the trend

The one-cycle view uses weekly bars; longer ranges show monthly income and spending bars side by side. Tap a period for the underlying records.

Understand the mix

Switch between income and spending categories, open category records and see the highest-spending merchants. Investment movements stay separate.

Read the numbers in context

Income after spending is not your bank balance. The current cycle is in progress; older cycles can be incomplete if imported history starts later. Future-dated records are excluded.

Feature status: monthly trend bars are available. A separate month-by-month change table and percentage-change summary are not part of this build.

12 / PRIVACY & PRACTICAL DETAILS

Built around your control.

Viyam is a local-first app for Android 7.0 and later, using LKR. No server, API key or tiny AI model is required for the current categorization experience.

On-device storage

Records and retained source alerts live in app-private storage. The current app requests no internet permission and does not upload your messages.

Permissions with a purpose

Read SMS supports import and discovery; Receive SMS supports incoming alerts. Notifications enable transaction prompts and actions. Manual entry works without SMS access.

What the current build supports

Supported examples include HNB purchases and credits, COMBANK card authorizations and cancellations, plus Amana POS purchases, transfers, credits and reversals. Supported formats extract transaction amounts separately from available balances. Duplicate source records are skipped on reimport, including equivalent local and +94 sender formats; existing classifications and ignore decisions are kept.

Every approved-sender alert is saved from your tracking date, including OTPs, promotions and unsupported formats. Unrecognized alerts go to Needs review and stay outside totals until you decide. Sender approval is not bank identity verification; an SMS authorization does not prove final settlement.

Keep this limitation in mind

The current build has no export, restore or cloud sync. Android backup is disabled. Uninstalling or clearing app data removes the local ledger and its saved classifications.
